

WHAT IS CLAIMED IS:

1. A cap feeding assembly for stapling gun, comprising:

a tube adapted to be connected a the stapling gun and having an open top and an open bottom, the open bottom being rested on a plate adapted to be connected to the stapling gun, a gap defined between a top surface of the plate and the open bottom of the tube, the open top having a threaded inner periphery;

a stack of caps each having a central hole defined therethrough, a connection cord having a ring connected to a first end of the cord and the cord frictionally fit in the central hole in each of the caps, the ring being larger than the central holes of the caps, an end piece integrally formed on a second end of the connection cord and being slightly larger than the inner diameter of the central hole of each cap such that the enlarged end piece moves through the central holes of the stack of the caps when pulling the connection cord from the stack of the caps; and

a pushing mechanism including a pushing rod which movably extends through a cover, the cover having a threaded outer periphery which is threadedly connected to the threaded inner periphery of the open top of the tube, a spring mounted to the pushing rod and includes a pushing end which pushes a top of the stack of the caps toward the plate.
